

BrightTV Viewership Analytics Project

Project Overview

This project focuses on analysing BrightTV's user profiles and viewing behaviour to identify opportunities for increasing customer engagement, consumption, and ultimately the company's subscription base.

BrightTV's CEO has set an objective to grow the company's subscription base during the current financial year. To support this objective, the Customer Value Management (CVM) team requires data-driven insights into how customers use the platform, what factors influence viewing consumption, and what content or initiatives could encourage users to watch more frequently and for longer periods.

The project will use the provided **User Profiles** and **Viewership** datasets to investigate customer demographics, viewing sessions, channels, viewing times, and consumption patterns. Each viewership record represents an individual viewing session. The analysis will also convert the supplied UTC timestamps into South African time, as required in the case study.

Project Objectives

The main objectives of the project are to:

1. Understand BrightTV users and usage trends

2. Analyse the demographic profile of BrightTV users.
3. Identify patterns in viewing frequency, duration, timing, and channel preferences.
4. Determine which customer segments have the highest and lowest levels of consumption.

5. Identify factors influencing consumption

6. Examine how demographics, time of day, day of week, channel/content type, and other available variables relate to viewing behaviour.
7. Identify characteristics associated with higher or lower consumption.

8. Identify opportunities to increase consumption

9. Determine which days and periods experience relatively low viewing activity.
10. Recommend content categories or programming strategies that could be used to stimulate viewing during these periods.
11. Identify customer segments that could benefit from targeted content recommendations.

12. Recommend initiatives to grow the BrightTV user base

13. Use the findings to propose customer acquisition and engagement initiatives.

14. Recommend strategies such as targeted campaigns, content-led acquisition, referrals, personalised recommendations, and segment-specific promotions where supported by the analysis.

15. Prioritise initiatives according to their potential impact on customer acquisition and engagement.

Data and Analytical Approach

The analysis will combine two key datasets:

- **User Profiles:** demographic information including age, gender, race, province, and user identifiers.
- **Viewership:** individual viewing sessions containing the user ID, channel, viewing date/time, and session duration.

The viewership data contains **10,000 viewing sessions across 4,386 unique users**, covering approximately three months of activity. The analysis will aggregate these sessions to user, date, time, channel, and demographic levels to identify meaningful consumption patterns.

The analysis will include descriptive statistics, segmentation, trend analysis, and comparisons between high- and low-consumption periods. Where appropriate, relationships between customer characteristics and viewing behaviour will be examined to determine which factors are most strongly associated with consumption.

Expected Deliverables

The final output will be a **20-minute business presentation** containing:

- An overview of BrightTV's user and usage trends.
- Key customer and consumption insights.
- Analysis of the factors influencing viewing consumption.
- Identification of low-consumption days or periods.
- Content recommendations to increase consumption during low-activity periods.
- Recommended initiatives to grow BrightTV's user base.
- Clear, actionable conclusions for the CVM team.

The ultimate goal is to translate the viewing data into **practical business recommendations that can increase engagement, improve customer acquisition, and support BrightTV's subscription-growth objective**.
